1 INTRODUCTION

1.1 Document organization and format

Chapter 1 – Introduction - Provides an overview of the manual. This section of the introduction summarizes the remaining chapters and appendices.

Chapter 2 – C Library Installation - Describes the procedures necessary for successful installation and operation of the Gryphon C Library.

Chapter 3 – C Library Overview – Describes the structure and concepts of the Gryphon C Library.

Chapter 4 – C Library Reference – Details the syntax and semantics of each function in the Gryphon C Library.

1.2 Technical support

In the U.S., technical support representatives are available to answer your questions between 9 a.m. and 5 p.m. EST. You may also fax or e-mail your questions to us. Please include your [voice] telephone number, for prompt assistance. Non-U.S. users may choose to contact their local representatives.

Phone: (248) 888-2000
 Fax: (248) 888-9977
 e-mail: techsupp@dgtech.com
 web site: http://www.dgtech.com

1.3 References

Ref.	Title	Rev/Date/URL
1	Gryphon Installation Manual	Version 1.0
2	Gryphon Hardware & Communication Manual	<a href="http://<Gryphon IP address>/html/">http://<Gryphon IP address>/html/

2 C Library Installation

Please complete the registration card, and return it via fax or mail. You may also log on to our Web site to register this product on-line. As a registered user, you will receive technical support and important product upgrade information.

2.1 Installation for Windows Platforms

- Insert the Setup CD into the CD-ROM drive.
- Click on Start, Run...
- Type D:\gryphdll.exe (If “D” is your PC’s CD-ROM label; otherwise replace “D” with the correct label for your CD-ROM drive).
- Follow the instructions on the screen.

2 Installation for Unix Platforms

A source code distribution is available for Unix (and other) platforms, which includes suggested Makefiles. Please refer to the UNIX_README file in the distribution for details.

3 C Library Overview

The Gryphon C Library was developed by the Dearborn Group to provide a high level interface to Gryphon services for application development using the C language, and other C-interface compatible languages like Visual BASIC and LabWindows/CVI. Current platforms supported include Linux (and most Unix variants) with pthread support, and all 32-bit versions of MS Windows with threading support.

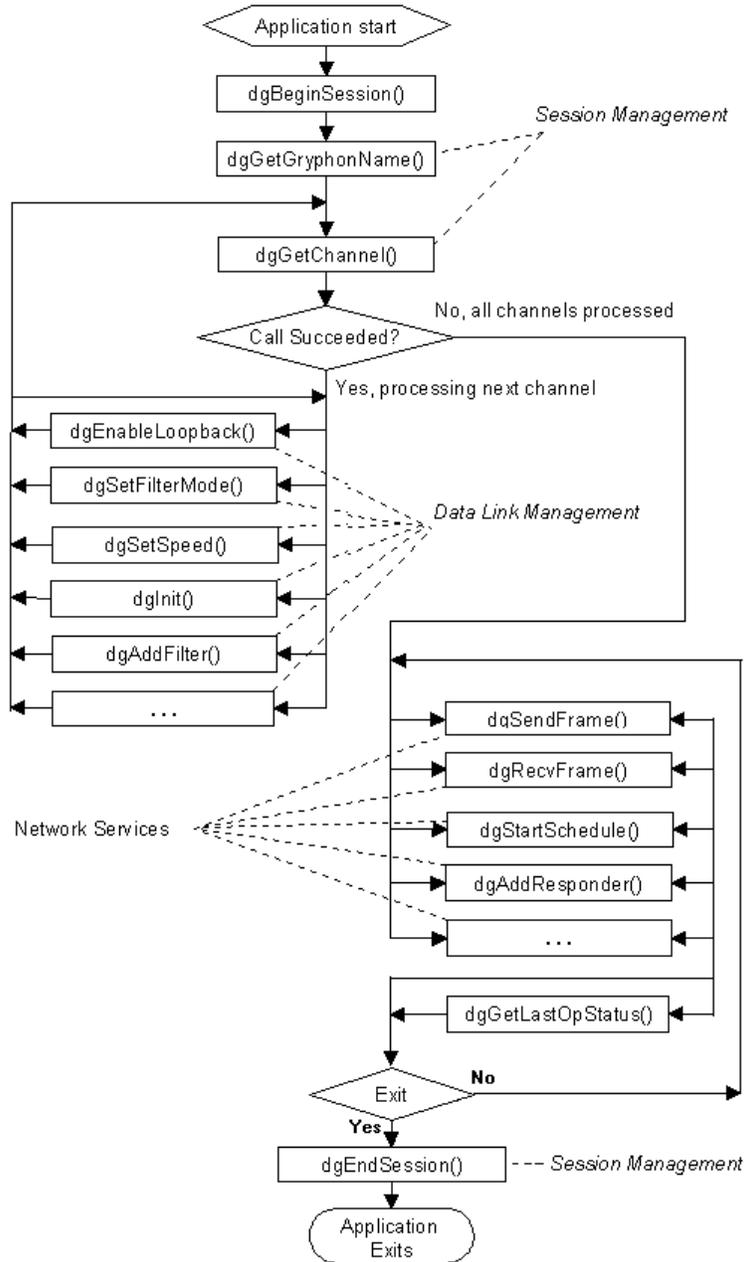

The Gryphon C Library is a thin wrapper over the Gryphon C++ Library. The main motivation for its creation was the wider compatibility with other languages that the C-interface provides. Because of its dependency on the C++ Library, the reader is often referred in this manual to the C++ Library manual for further functional details.

3.1 General Notes

- All parameter data are in host byte order; transformations to and from network byte order are handled by the library.
- "GC frame" is shorthand for "Gryphon Communication Protocol message frame".
- All GC frame padding is handled by the library.
- "Payload" or "payload message" refers to a message sent or received over the network connected to a Gryphon channel; e.g., a CAN message.
- Function declarations are in file "dggryphC.h".
- Buffers returned from functions are always null-terminated and truncated to the length passed into parameter `max_len`, with the exception of `dgFrameGetData`.
- Unless otherwise specified, all functions return a boolean value to determine if the function succeeded or failed.

3.2 Library Structure

3.2.1 Flowchart of Typical Use

3.2.2 Handles to Objects

The library makes extensive use of different custom handles. Each handle is used to reference some type of library object, e.g. a Gryphon session, a Gryphon channel, a channel filter, etc.

All handles, except for `dgSessionHandle`, `dgEventTypeHandle`, and `dgChannelHandle`, are created by explicitly calling a create function; e.g. **`dgCreateScheduleHandle()`**. To create a `dgSessionHandle`, `dgEventTypeHandle`, or `dgChannelHandle` call the following functions:

`dgBeginSession()` for `dgSessionHandle`
`dgGetEventType()` for `dgEventTypeHandle`
`dgGetChannel()` for `dgChannelHandle`

To free any handle, call the function **`dgFreeHandle()`**.

The first parameter in most functions in this library requires a handle. If an invalid handle or a handle of the wrong type is passed to a function, it will fail and `dgGetLastOpStatus()` will return `RESP_INVALID_PARAM`.

Please see the documentation below for more information on each function and handle type.

Handle Types:

The following are the handles that are used in this library.

<code>dgSessionHandle</code>	Represents the client/server session with the Gryphon device.
<code>dgClientHandle</code>	A client process of the Gryphon server.
<code>dgChannelHandle</code>	A vehicle network channel on the Gryphon.
<code>dgChannelSpeedHandle</code>	Used in setting a channel speed.
<code>dgFrameHandle</code>	A GC frame.
<code>dgFilterHandle</code>	A specification of a Gryphon message filter, which provides the capability to filter messages received over a vehicle network channel.
<code>dgFilterBlockHandle</code>	Used in building a message filter.
<code>dgScheduleHandle</code>	A specification of a Gryphon message schedule, which is a list of messages to be transmitted over a channel, with iteration and interval capabilities.

occurred. Use **dgGetLastOpStatus()** to obtain more information on the error condition. Functions that do not behave in this way are documented individually.

Example:

```
unsigned int errnum;
char errstr[max];
dgGetLastOpStatus( &errnum, errstr, max );
```

4.1.2 dgLibGetVersion

Function	Get the version string of the library.
Syntax	void dgLibGetVersion (unsigned char * str , size_t max_len)
Remarks	<i>str</i> points to the library version string after function return.

Example:

```
size_t max_len = 1024;
unsigned char tempstr[max_len];
dgLibGetVersion ( tempstr, max_len );
```

4.1.3 dgFreeHandle

Function	Frees any handle created by this library and returns the resources to the system.
Syntax	int dgFreeHandle (dgHandle)
Remarks	If this function is called passing a dgSessionHandle, the function will free the dgSessionHandle as well as all handles of type dgChannelHandle associated with it.

Example:

```
dgSessionHandle mygryphon;  
result = dgFreeHandle( mygryphon );
```

4.2 Session Management

Functions in this section provide information about, and control characteristics of, a client/server session with a Gryphon.

4.2.1 dgBeginSession

Function Creates a dgSessionHandle, initiates the TCP session and registers with the Gryphon server.

Syntax dgSessionHandle **dgBeginSession** (struct dgSessionRequest *)

Remarks The struct **dgSessionRequest** has the following members:

addr Hostname or IP address of Gryphon

username Currently not implemented on Gryphon.

password Currently not implemented on Gryphon

srcType The source/destination type to register as.

port Port number of the server application on Gryphon.

Typical values for these parameters:

IP address: 192.168.1.1

Username: none

Password: none

SrcType: SD_CLIENT

Port: 7000

Return Value Returns 0 if an error occurred; otherwise returns a valid handle for the session. The handle is then used in other function calls to identify the relevant Gryphon session. The use of multiple concurrent Gryphon sessions is supported.

Example:

Example changing the IP address:

```
strcpy( dgDefaultSession.gryphon_addr, "192.168.1.100" );
gryph_session = dgBeginSession( &dgDefaultSession );
```

4.2.2 dgEndSession

Function End the TCP session with the Gryphon server.

Syntax int **dgEndSession** (dgSessionHandle, int *flush*)

Remarks Parameter *flush* is a boolean value: if the value supplied is TRUE, any incoming frames previously enqueued by the library, and not yet retrieved by **dgRecvFrame()**, are deleted. Otherwise, enqueued frames can be retrieved after the call to **dgEndSession()**

Example:

```
result = dgEndSession(my_session, TRUE);
```

4.2.3 dgSessionActive

Function Check if the TCP session is still valid and the client is still connected to the Gryphon.

Syntax int **dgSessionActive** (dgSessionHandle)

Remarks None.

Example:

```
if ( dgSessionActive( my_session ) ) {
    // Session is active
}
else {
    // Session is NOT active
}
```

4.2.4 dgGryphonGetName

Function	Get the name of the connected Gryphon server.
Syntax	int dgGryphonGetName (dgSessionHandle, unsigned char * <i>str</i> , size_t <i>max_len</i>)
Remarks	If this function returns TRUE, then <i>str</i> contains the Gryphon Name.

Example:

```
unsigned char tempstr[1024];
size_t max_len;
max_len=1024;
result = dgGryphonGetName (my_session, tempstr, max_len);
```

4.2.5 dgGryphonGetSerial

Function	Get the serial number (Ethernet MAC address) of the Gryphon.
Syntax	int dgGryphonGetSerial (dgSessionHandle, unsigned char * <i>str</i> , size_t <i>max_len</i>)
Remarks	If this function returns TRUE, then <i>str</i> contains the Gryphon serial number.

Example:

```
unsigned char m_tempstr[1024];
size_t max_len;
max_len=1024;
result = dgGryphonGetSerial (my_session, m_tempstr, max_len);
```

4.2.6 dgGryphonGetVersion

Function	Get the version number of the Gryphon server.
Syntax	int dgGryphonGetVersion (dgSessionHandle, unsigned char * str , size_t max_len)
Remarks	If this function returns TRUE, then <i>str</i> contains the Gryphon version.

Example:

```
unsigned char tempstr[1024];
size_t max_len;
max_len=1024;
result = dgGryphonGetVersion (my_session, tempstr, max_len);
```

4.2.7 dgGetId

Function	Get the identifier assigned by the Gryphon server for the session.
Syntax	int dgGetId (dgSessionHandle, unsigned char *)
Remarks	Normally, the user registers with the Gryphon server as a client (SD_CLIENT); this is the default value of the <i>srcType</i> parameter of BeginSession (). In this case, this function will retrieve the "client Id" which will be valid for the duration of the session.

Example:

```
unsigned char my_clientId;
result = dgGetId( my_session, &my_clientId );
```

4.2.8 dgGetChannel

Function	Get a handle to a channel on the connected Gryphon.
Syntax	dgChannelHandle dgGetChannel (dgSessionHandle, unsigned char <i>index</i>)
Remarks	<p>The parameter <i>index</i> is a zero-based integer index into the array of hardware channels installed on the Gryphon.</p> <p>This function creates a dgChannelHandle and links it to the associated hardware channel. It returns 0 on error. If the function returns a non-zero handle, the handle can be used to access the hardware channel's information and services.</p>

Example:

```
dgChannelHandle my_channel;
my_channel = dgGetChannel( my_session, 0 );
```

4.2 dgSetTimeout

Function	Set the timeout period for all of the Gryphon library functions.
Syntax	int dgSetTimeout (dgSessionHandle, unsigned int <i>ms</i>)
Remarks	<p>If set to zero, the function will return immediately. If the operation did not complete, the member function dgGetLastOpStatus() will return a RESP_TIMEOUT value.</p> <p>The specified timeout is in effect for the duration of the session, or until the function is called again with a different timeout value.</p> <p>The library's default timeout value is 500 ms.</p>

Example:

```
Example using a numeric value:
result = dgSetTimeout(my_session, 1000); //timeout = 1000 ms = 1 s.
```

Example using a variable:

```
unsigned int m_timeout=0;
result = dgSetTimeout(my_session, m_timeout); //timeout = 0 ms.
```

4.2.10 dgEnableBroadcastRx

Function	Enable or disable reception of broadcast messages.
Syntax	int dgEnableBroadcastRx (dgSessionHandle, int <i>flag</i>)
Remarks	The parameter <i>flag</i> is a boolean value which enables or disables reception of broadcast messages.

Example:

```
result = dgEnableBroadcastRx(my_session, TRUE);
// Enable reception of broadcast messages
```

4.2.11 dgSetCommOpt

Function	Set the optimization of the TCP link between the Gryphon server and this client.
Syntax	int dgSetCommOpt (dgSessionHandle, unsigned char <i>flags</i>)
Remarks	Optimization can be set to minimize latency (Nagle algorithm disabled) or maximize throughput (Nagle algorithm enabled). <i>flags</i> is a bitfield which can represent these values: COMMOPT_THROUGHPUT: Maximize throughput (default) COMMOPT_LATENCY_SRVR: Minimize latency of server-to-client communication (disable Nagle algorithm at the server socket) COMMOPT_LATENCY_CLNT: Minimize latency of client-to-server communication (disable Nagle algorithm at the client socket)

The use of a "latency" flag will override the "throughput" optimization in the selected direction of communication.

Example:

```
// optimize latency in both directions:
result = dgSetCommOpt( my_session, COMMOPT_LATENCY_SRVR +
                        COMMOPT_LATENCY_CLNT );
```

4.2.12 dgSetSortMode

Function Set the server's data message sorting behavior.

Syntax int **dgSetSortMode** (dgSessionHandle,
unsigned char *mode*)

Remarks *mode:*
0 No sorting performed (default)
1 Block of up to 16 messages sorted.

Example:

```
result = dgSetSortMode(my_session, 1); // Turn sorting on
```

4.2.13 dgFlushQueue

Function Empty the received frame queue.

Syntax int dgFlushQueue (dgSessionHandle)

Remarks Empties the queue of GC frames received by the library from the connected Gryphon, but not yet retrieved by the application via calls to **dgRecvFrame()**.

Example:

```
if (dgFlushQueue( my_session ) ) {
    // queue is emptied
}
```

4.2.14 dgGryphonGetTime

Function	Get the Gryphon time value, in seconds.
Syntax	int dgGryphonGetTime (dgSessionHandle, time_t*)
Remarks	time_t will retrieve the 32- bit time in seconds (standard C time).

Example:

```
time_t m_time;
result = dgGryphonGetTime(my_session, &m_time);
// 32-bit time (seconds)
```

4.2.15 dgGryphonSetTime

Function	Set the Gryphon time value, in seconds.
Syntax	int dgGryphonSetTime (dgSessionHandle, time_t)
Remarks	Setting the Gryphon time with this function sets the fractional portion of the Gryphon time to zero.

Example:

```
time_t m_time;
// Initialize m_time
result = dgGryphonSetTime(my_session, m_time);
```

4.2.16 dgGryphonGetTimestamp

Function	Get the 32- bit Gryphon timestamp.
Syntax	int dgGryphonGetTimestamp (dgSessionHandle, unsigned int*)
Remarks	None.

Example:

```
unsigned int m_timestamp;
result = dgGryphonGetTimestamp(my_session, &m_timestamp);
```

4.2.17 dgGryphonSetTimestamp

Function Set the 32-bit Gryphon timestamp.

Syntax int **dgGryphonSetTimestamp** (dgSessionHandle, unsigned int)

Remarks None.

Example:

```
unsigned int m_timestamp;
// Initialize m_timestamp
result = dgGryphonSetTimestamp( my_session, m_timestamp );
```

4.3 Data Link Management

Functions in this section provide information about a Gryphon's installed data link hardware, and control of the data link operating parameters.

4.3.1 Device Identification

4.3.1.1 dgChannelGetName

Function Get the name of the channel device.

Syntax int **dgChannelGetName** (dgChannelHandle,
unsigned char ***str**,
size_t **max_len**)

Remarks If this function returns TRUE, then **str** points to the name of the channel.

Example:

```
unsigned char tempstr[1024];
size_t max_len;
max_len=1024;
result = dgChannelGetName (my_channel, tempstr, 1024 );
```

4.3.1.2 dgChannelGetSecurity

Function Get the encrypted device security string of the channel device.

Syntax int **dgChannelGetSecurity** (dgChannelHandle,
unsigned char ***str**,
size_t **max_len**)

Remarks If this function returns TRUE, then **str** points to the security string.

Example:

```
unsigned char tempstr[1024];
size_t max_len;
max_len=1024;
result = dgChannelGetSecurity (my_channel, tempstr, 1024 );
```

4.3.1.3 dgChannelGetSerial

Function	Get the serial number of the channel device.
Syntax	int dgChannelGetSerial (dgChannelHandle, unsigned char * <i>str</i> , size_t <i>max_len</i>)
Remarks	If this function returns TRUE, then <i>str</i> contains the serial number.

Example:

```
unsigned char tempstr[1024];
size_t max_len;
max_len=1024;
result = dgChannelGetSerial (my_channel, tempstr, 1024 );
```

4.3.1.4 dgChannelGetVersion

Function	Get version identification of the channel device.
Syntax	int dgChannelGetVersion (dgChannelHandle, unsigned char * <i>str</i> , size_t <i>max_len</i>)
Remarks	If this function returns TRUE, then <i>str</i> contains the version.

Example:

```
unsigned char tempstr[1024];
size_t max_len;
max_len=1024;
result = dgChannelGetVersion (my_channel, tempstr, 1024 );
```

4.3.1.5 dgChannelGetSlot

Function	Get the slot number of the channel device.
Syntax	int dgChannelGetSlot (dgChannelHandle, unsigned char* <i>slot</i>)
Remarks	None.

Example:

```
unsigned char m_slotnum;
result = dgChannelGetSlot(my_channel, &m_slotnum);
```

4.3.1.6 dgChannelGetType

Function Get the channel type (e.g. CAN, J1850, etc)

Syntax int **dgChannelGetType** (dgChannelHandle,
unsigned char* *type*)

Remarks None.

Example:

```
unsigned char m_type;
result = dgChannelGetType(my_channel, &m_type);
```

4.3.1.7 dgChannelGetSubtype

Function Get the subtype of the channel.

Syntax int **dgChannelGetSubtype**(dgChannelHandle,
unsigned char* *subtype*)

Remarks None.

Example:

```
unsigned char m_subtype;
result = dgChannelGetSubtype(my_channel, &m_subtype);
```

4.3.1.8 dgGetDataMaxLen

Function Get the maximum length, in bytes, of the "data" portion of the channel's network frame format.

Syntax int **dgGetDataMaxLen** (dgChannelHandle,
unsigned short* *length*)

Remarks None.

Example:

```
unsigned short m_maxlen;
result = dgGetDataMaxLen(my_channel, &m_maxlen);
```

4.3.1.9 dgGetDataMinLen

Function Get the minimum length, in bytes, of the "data" portion of the channel's network frame format.

Syntax int **dgGetDataMinLen** (dgChannelhandle,
unsigned short* *length*)

Remarks None.

Example:

```
unsigned short m_minlen;
result = dgGetDataMinLen(my_channel, &m_minlen);
```

4.3.1.10 dgGetExtraMaxLen

Function Get the maximum length, in bytes, of the "extra" portion of the channel's network frame format.

Syntax int **dgGetExtraMaxLen** (dgChannelHandle,
unsigned short* *length*)

Remarks None.

Example:

```
unsigned short m_extramaxlen;
result = dgGetExtraMaxLen(my_channel, &m_extramaxlen);
```

4.3.1.11 dgGetExtraMinLen

Function Get the minimum length, in bytes, of the "extra" portion of the channel's network frame format.

Syntax int **dgGetExtraMinLen** (dgChannelHandle,
unsigned short* *length*)

Remarks None.

Example:

```
unsigned short m_extraminlen;
result = dgGetExtraMinLen(my_channel, &m_extraminlen);
```

4.3.1.12 dgGetValidHeaderLength

Function Get the valid header lengths for the channel's network frame format.

Syntax int **dgGetValidHeaderLength**(dgChannelHandle,
unsigned char *index*,
size_t* *length*)

Remarks Through iterated calls, starting with *index* set to zero, this function returns all the valid header lengths for the channel's network frame format. When zero return value is obtained, the list has been exhausted.

Example:

```
size_t firstheaderlength;
result = dgGetValidHeaderLength( my_channel, 0, &firstheaderlength);
```

4.3.1.13 dgGetNodeId

Function Get the numeric identifier of the channel node.

Syntax int **dgGetNodeId**(dgChannelHandle,
unsigned char **id*);

Remarks *id* can be used to determine the source channel of a GC frame received via **dgRecvFrame()**. If the frame originated from this channel, the value of *id* will match the value returned by **dgGetSrcChannel()** for that frame handle.

4.3.2 General Configuration

4.3.2.1 dgSetFilterMode

Function Specify whether messages received by the node are to be

4.3.2.3 dgEnableLoopback

Function Enable or disable the echo back to the client application of transmitted messages.

Syntax int **dgEnableLoopback** (dgChannelHandle, int *boole*)

Remarks Default = no loopback

Example:

```
result = dgEnableLoopback( my_channel, TRUE );
```

4.3.2.4 dgIOctl

Function This function gives access to generic I/O functions and channel (expansion module)-specific I/O functions.

Syntax int **dgIOctl**(dgChannelHandle,
 unsigned int *num*,
 unsigned char* *data*,
 size_t *length*)

Remarks For more information on the **IOctl** parameters please see the Gryphon module documentation.

Example:

```
unsigned int m_ionum;  
unsigned char m_iodata;  
size_t m_len;  
// m_ionum, m_iodata, m_len are all initialized to valid values  
result = dgIOctl(my_channel, m_ionum, &m_iodata, m_len);
```

4.3 Event Management

4.3.3.1 dgReportAllEvents

Function Enable or disable reporting of all node events to the client application.

4.3.3.3 dgGetEventType

Function Create a dgEventTypeHandle in order to get information on the type of events that may be signaled by the channel.

Syntax dgEventTypeHandle **dgGetEventType**(dgChannelHandle, unsigned char *index*)

Remarks The function returns 0 on error, or a dgEventTypeHandle on success. If a non-zero handle is returned it can be used in other functions to represent the event type.

Example:

```
dgEventTypeHandle m_event;
m_event = dgGetEventType(my_channel, 0);
```

4.3.3.4 dgGetEventTypeId

Function Get the numeric identifier for the event type.

Syntax int **dgGetEventTypeId**(dgEventTypeHandle, dgEventId*)

Remarks None.

Example:

```
dgEventId my_eventId;
result = dgGetEventTypeId( my_event, &my_eventId);
```

4.3.3.5 dgGetEventTypeMeaning

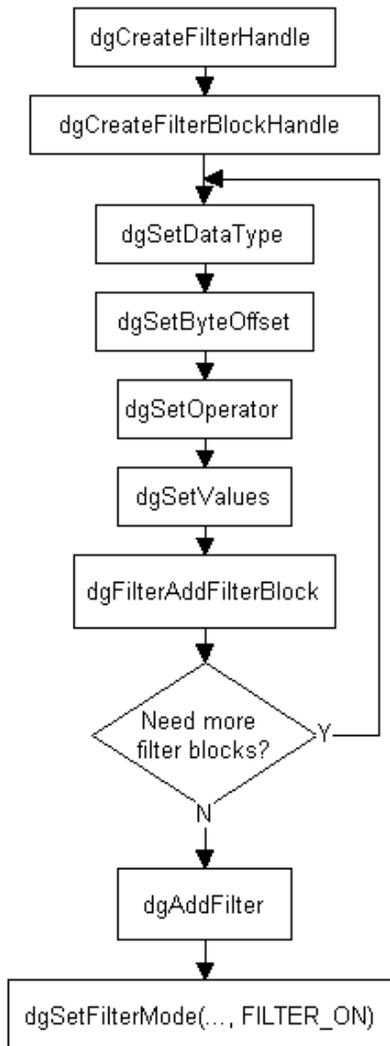

Function	Get the text string description of the event.
Syntax	int dgGetEventTypeMeaning (dgEventTypeHandle, unsigned char * <i>str</i> , size_t <i>max_len</i>)
Remarks	None.

Example:

```
unsigned char meaning[1024];  
size_t max_len = 1024;  
result = dgGetEventTypeMeaning( my_event, meaning, max_len );
```

4.3.4 Message Filter Management

For an overview, the following flowchart illustrates a typical way to set up a message filter:

4.3.4.1 dgCreateFilterHandle

Function	Create and return a dgFilterHandle.
Syntax	dgFilterHandle dgCreateFilterHandle()
Remarks	None.

Example:

```
dgFilterHandle myfilter = dgCreateFilterHandle();
```

4.3.4.2 dgAddFilter

Function	Add the filter represented by the dgFilterHandle, to the channel.
Syntax	int dgAddFilter (dgChannelHandle, dgFilterHandle)
Remarks	None.

Example:

```
dgFilterHandle myfilter;
// myfilter is initialized and set with a dgFilterBlockHandle
result = dgAddFilter(my_channel, myfilter);
```

4.3.4.3 dgModifyFilter

Function	Modify the previously added filter.
Syntax	int dgModifyFilter (dgChannelHandle, dgFilterHandle, unsigned char <i>action</i>)
Remarks	<i>action</i> values: ACTIVATE_FILTER, DEACTIVATE_FILTER

4.3.4.4 dgDeleteFilter

Function	Delete the filter from the channel.
-----------------	-------------------------------------

Example:

```
result = dgFilterSetAction ( my_filter, FILTER_FLAG_BLOCK );
```

```
result = dgFilterSetAction ( my_filter, FILTER_FLAG_PASS );
```

4.3.4.7 dgFilterSetLogicalOp

Function Specify whether the filter blocks are to be ANDed or ORed together.

Syntax int **dgFilterSetLogicalOp** (dgFilterHandle,
unsigned char *op*)

Remarks *op*:

FILTER_FLAG_AND_BLOCKS All of the filter blocks must be true in order for a message to conform to the filter.

FILTER_FLAG_OR_BLOCKS Only one of the filter blocks must be true in order for a message to conform to the filter.

The default state of this attribute is **FILTER_FLAG_AND_BLOCKS**.

Example:

```
result = dgFilterSetLogicalOp ( my_filter, FILTER_FLAG_OR_BLOCKS );
```

4.3.4.8 dgSetDefaultFilterAction

Function Specify the action to be taken when a message fails to conform to all of the active filters for the channel.

Syntax int **dgSetDefaultFilterAction**(dgChannelHandle,
unsigned char *action*)

Remarks *action*:

DEFAULT_FILTER_BLOCK : messages not conforming to any of the active filters will not be passed to the client. This is the default state.

DEFAULT_FILTER_PASS : messages not conforming to any of the active filters will be passed to the client.

Example:

```
result = dgSetDefaultFilterAction(my_channel, DEFAULT_FILTER_PASS);
```

4.3.4.9 dgCreateFilterBlockHandle

Function Create and return a dgFilterBlockHandle.

Syntax dgFilterBlockHandle **dgCreateFilterBlockHandle()**

Remarks**Example:**

```
dgFilterHandle myfilter;
myfilter = dgCreateFilterBlockHandle();
```

4.3.4.10 dgFilterAddFilterBlock

Function Add a filter block to a filter.

Syntax int **dgFilterAddFilterBlock** (dgFilterHandle,
dgFilterBlockHandle)

Remarks Filter blocks specify a section of the message to be checked. In order for a message to conform to a filter, it must conform to all of the defined filter blocks associated with that filter.

This function involves a copy operation performed on the filter block object referenced by the second parameter. Once the copy is made, the filter block might be modified and reused in the same or another filter object. Thus, changes made to the filter block after the call to **dgFilterAddFilterBlock()** have no effect on the referenced filter object.

Example:

```
dgFilterBlockHandle my_block;
// my_block is initialized
result = dgFilterAddFilterblock(my_filter, my_block);
```

4.3.4.11 dgSetDataType

Function Specify which portion of the message the Byte Offset field references.

Syntax int **dgSetDataType** (dgFilterBlockHandle,
unsigned char *datatype*)

Remarks *datatype*:
 FILTER_DATA_TYPE_HEADER_FRAME – Message Header Frame (prepend to the message by the Gryphon)
 FILTER_DATA_TYPE_HEADER -- Message Header
 FILTER_DATA_TYPE_DATA -- Message Data
 FILTER_DATA_TYPE_EXTRA_DATA – Message extra data

Example:

```
result = dgSetDataType( my_filterblock, FILTER_DATA_TYPE_DATA );
```

4.3.4.12 dgSetByteOffset

Function Identify the location of the section of the message to be checked.

Syntax int **dgSetByteOffset**(dgFilterBlockHandle,
unsigned short *offset*)

Remarks The Byte Offset is from the beginning of the portion of the message specified in the Data Type Index. Note that the message header is right justified in its byte field.

Example:

```
unsigned short m_offset;  
result = dgSetByteOffset ( my_filterblock, 0 );  
  
// m_offset is initialized  
result = dgSetByteOffset ( my_filterblock, m_offset );
```

4.3.4.13 dgSetOperator

Function Specify the type of comparison to be done in this filter block.

Syntax int **dgSetOperator**(dgFilterBlockHandle,
unsigned char *operator*)

Remarks	<i>operator</i>	Value 1	Value 2	Notes
	BIT_FIELD_CHECK	Pattern	Mask	Bit check with 0, 1 and don't care
	SVALUE_GT	Value	Not used	Signed value compare
	SVALUE_GE	Value	Not used	Signed value compare
	SVALUE_LT	Value	Not used	Signed value compare
	SVALUE_LE	Value	Not used	Signed value compare
	VALUE_EQ	Value	Not used	Check for value equality
	VALUE_NE	Value	Not used	Check for value inequality
	UVALUE_GT	Value	Not used	Unsigned value compare
	UVALUE_GE	Value	Not used	Unsigned value compare
	UVALUE_LT	Value	Not used	Unsigned value compare
	UVALUE_LE	Value	Not used	Unsigned value compare
	DIG_LOW_TO_HIGH	Bit Mask	Not used	Check for 0 to 1
	DIG_HIGH_TO_LOW	Bit Mask	Not used	Check for 1 to 0
	DIG_TRANSITION	Bit Mask	Not used	Check for change

BIT_FIELD_CHECK
A message conforms to a BIT_FIELD_CHECK Filter Block when the specified message byte(s) are identical those in the Pattern. The Mask allows portions of one or more message bytes to be ignored. Each bit set in the Mask indicates that the corresponding bit in the message must match the corresponding Pattern bit. Each bit cleared in the Mask indicates that the corresponding bit in the message may be either set or reset.

SVALUE, VALUE and UVALUE comparisons

A message conforms to one of these Filter Blocks when the specified message byte(s) is taken as a signed or unsigned character, or the short or long value (8, 16 or 32 bits) is greater than, etc. the value present in Value1.

DIG comparisons

A message conforms to one of these Filter Blocks when the specified bit makes a low to high or a high to low transition or changes state. The Bit Mask is used to isolate a single bit to be checked in a byte. If bit 0, the significant bit, is to be checked, the Bit Mask should be set to 1.

The filter mask qualifies the filter pattern by specifying which bits are required and which bits are to be ignored. A bit value of 1 indicates that the corresponding bit in the pattern needs to be matched. A bit value of 0 indicates the corresponding bit in the pattern is not checked (always matches).

Example:

```
result = dgSetOperator( my_filterblock, VALUE_EQ );
```

4.3.4.14 dgSetValues

Function	Set the object's "First Value" attribute, and optionally the "Second Value" attribute.
Syntax	int dgSetValues (dgFilterBlockHandle, unsigned short <i>length</i> , unsigned char* <i>value1</i> , unsigned char* <i>value2</i>)
Remarks	<p>This command sets the values by reading the number of bytes indicated by the length parameter from memory pointed to by the 'value1' parameter.</p> <p>If the operator of the object has been set to "BIT_FIELD_CHECK", then the 'Second Value' attribute is also set , likewise, by reading the number of bytes indicated by the length parameter from memory pointed to by the 'value2' parameter.</p> <p>This rule implies that dgSetOperator() must be called before this function can succeed.</p>

Example:

```
// dependant on what was used in SetOperator()
```

```
unsigned char m_val1, m_val2;  
unsigned short m_num;  
  
// m_num and m_val1 are initialized  
result = dgSetValues ( my_filterblock, m_num, &m_val1 );  
  
// m_num, m_val1 and m_val2 are initialized and SetOperator used  
// BIT_FIELD_CHECK  
result = dgSetValues ( my_filterblock, m_num, &m_val1, &m_val2 );
```

4.3.5 Channel Speed Management

4.3.5.1 dgGetSpeed

Function Get the current speed characteristics of the specified channel.

Syntax int **dgGetSpeed** (dgChannelHandle,
dgChannelSpeedHandle *speed*)

Remarks If the function returns TRUE, then the Channel Speed information is stored in *speed* for use in other function calls.

Example:

```
dgChannelSpeedHandle my_chanspeed;
result=dgGetSpeed(my_channel, my_chanspeed);
```

4.3.5.2 dgSetSpeed

Function Set the current speed characteristics for the specified channel.

Syntax int **dgSetSpeed** (dgChannelHandle,
dgChannelSpeedHandle *speed*)

Remarks The bus speed, when modified with this command, takes effect only with a subsequent call to **dgInit()**

Example:

```
dgChannelSpeedHandle my_chanspeed;
result=dgGetSpeed(my_channel(0), my_chanspeed);
result=dgSetSpeed(my_channel(1), my_chanspeed);
```

4.3.5.3 dgGetPresetSpeed

Function Get information on the set of predefined speeds for a channel.

Syntax dgChannelSpeedHandle **dgGetPresetSpeed**
(dgChannelHandle,
unsigned char *index*)

Remarks The parameter *index* is a zero-based reference to the preset speed to be retrieved.

The function returns 0 on error.

Example:

```
dgChannelSpeedHandle my_chanspeed;
my_chanspeed = GetPresetSpeed(my_channel, 0);
```

4.3.5.4 dgGetGetSpeedIOCtl

Function The returned parameter value is the first parameter of the IOCtl function that may be used to manually retrieve the current network timing parameters for this channel.

Syntax int **dgGetGetSpeedIOCtl**(dgChannelHandle,
unsigned int* *ioctl_num*)

Remarks None.

Example:

```
unsigned int m_num;
if( dgGetGetSpeedIOCtl(&m_num) )
    result=dgIOCtl(m_num, ...);
```

4.3.5.5 dgGetSetSpeedIOCtl

Function The returned parameter value is the first parameter of the IOCtl function that may be used to manually set the network timing parameters for his channel.

Syntax int **dgGetSetSpeedIOCtl** (dgChannelHandle,
unsigned int* *ioctl_num*)

Remarks None.

Example:

```
unsigned int m_num;
if(dgGetSetSpeedIOCtl(my_channel, &m_num))
    result=dgIOCtl(my_channel, m_num, ...);
```

4.3.5.6 dgGetIOCtlData

Function Get the data which may be used in the data parameter of **dgIOCtl()** when setting the channel speed.

Syntax int **dgGetIOCtlData**(dgChannelHandle,
unsigned char* *buff*,
size_t *max*,
size_t* *actual*)

Remarks Parameter *buff* points to the user's buffer; data bytes will be copied to this buffer. Parameter *max* specifies the maximum number of bytes to copy to the buffer. The actual number of bytes copied will be written to the size_t pointed to by parameter *actual*.

Example:

```
unsigned char *m_databuffer;
size_t numread, total_size;
// initialize m_databuffer to an array of type unsigned char and set total_size
// to the size of m_databuffer
result = dgGetIOCtlData( my_channel, m_databuffer, total_size, &numread);
```

4.3.5.7 dgGetIOCtlDataSize

Function	Get the number of bytes of data which are expected to be used when calling dgIOCtl() to set the channel speed.
Syntax	Int dgGetIOCtlDataSize (dgChannelHandle, size_t*)
Remarks	None.

Example:

```
size_t m_datasize;
result = dgGetIOCtlDataSize( my_channel, &m_datasize );
```

4.3.5.8 dgGetSpeedDataSize

Function	Get the number of bytes of data associated with each speed.
Syntax	size_t dgGetSpeedDataSize (dgChannelHandle)
Remarks	None.
Return Value	Value will return 0 if error occurred, else the number returned is this size of the speed data.

Example:

```
size_t m_datasize;
m_datasize=dgGetSpeedDataSize(my_channel);
```

4.3.6 Bus Load Monitoring

4.3.6.1 dgSetBLMParams

Function	Specify the bus load monitor behavior.
Syntax	int dgSetBLMParams (dgChannelHandle, unsigned int <i>mode</i> , unsigned int <i>averaging_period</i>)
Remarks	<p>mode: Indicates the desired bus load monitor mode.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> 0 BLM off 1 BLM average over time 2 BLM average over frame count <p>averaging_period: Indicates the period over which averages are calculated.</p> <p>If mode=1 (Time average): averaging_period is interpreted as a time period in units of milliseconds.</p> <p>If mode=2 (Frame count average): averaging_period is interpreted as a message count.</p>

Examples:

```
unsigned int m_avgperiod = 1000; // Bus load monitoring done over 1s.
result = dgSetBLMParams(my_channel, 1, m_avgperiod);
```

```
m_avgperiod=100; // Bus load monitoring done over next 100 messages.
result = dgSetBLMParams(my_channel, 2, m_avgperiod);
```

```
result = dgSetBLMParams( my_channel, 0, 0 ); // turn BLM off
```

4.3.6.2 dgGetBLMStats

Function	Get the BLM and other statistics.
Syntax	int dgGetBLMStats (dgChannelHandle, unsigned int* <i>timestamp</i> , unsigned short* <i>blAvg</i> ,

unsigned short* *blNow*,
 unsigned short* *blPeak*,
 unsigned short* *blHistoricPeak*,
 unsigned int* *rxCnt*,
 unsigned int* *txCnt*,
 unsigned int* *rxDropCnt*,
 unsigned int* *txDropCnt*,
 unsigned int* *rxErrCnt*,
 unsigned int* *txErrCnt*)

Remarks

The statistics received will include bus load, total frames received, total frames transmitted, total frames dropped by the device driver and average bus load.

<i>timestamp</i>	System time at which the last bus load reading occurred
<i>blAvg</i>	Average bus load on the channel
<i>blNow</i>	Current bus load on the channel
<i>blPeak</i>	TBD
<i>blHistoricPeak</i>	Highest bus load during the averaging period
<i>rxCnt</i>	Total frames received on a channel since the bus load monitor was enabled
<i>txCnt</i>	Total frames transmitted on a channel since the bus load monitor was enabled
<i>rxDropCnt</i>	Total received frames dropped since the bus load monitor was enabled
<i>txDropCnt</i>	Total transmitted frames dropped since the bus load monitor was enabled
<i>rxErrCnt</i>	Total received frame errors since the bus load monitor was enabled
<i>txErrCnt</i>	Total transmitted frame errors since the bus load monitor was enabled

4.4 Network Services – Primary

Functions in this section provide the primary methods for sending and receiving bus data frames over a Gryphon's installed data link hardware channels. Also included is the primary function to obtain asynchronous notification of bus data frame reception.

4.4.1 Principal Functions

4.4.1.1 dgSendFrame

Function Transmit a frame via the target channel or to a target client.

Syntax int **dgSendFrame** (dgSessionHandle,
dgGryphonNodeHandle *target*,
dgFrameHandle *frame*)

Remarks The parameter *target* can be a dgChannelHandle, a dgClientHandle, a dgUSDTHandle or a generic dgGryphonNodeHandle.

To broadcast a frame to all clients (which have enabled broadcast reception), use the value CH_BROADCAST as the Id of the *target* dgClientHandle.

This function changes the 'Source' field of the Frame Header of the GC frame represented by *frame* to the value specified by parameter member *srcType* in the earlier invocation of **dgBeginSession()**.

This function changes the 'Source Channel' field of the Frame Header of the GC frame represented by *frame* to the value of the "Client ID" returned by the Gryphon server in the earlier invocation of **dgBeginSession()**.

This function changes the 'Destination' field of the Frame Header of the GC frame represented by *frame* to the value of the node type of the *target* Gryphon node. See also **dgGetNodeType()**.

This function changes the 'Destination Channel' field of the Frame Header of the GC frame represented by *frame* to the value of the node ID of the *target* Gryphon node. See also

dgGetNodeId().**Example:**

```

dgDataFrame my_dataframe;
dgChannelHandle my_channel;
// my_dataframe and my_channel are initialized
result = dgSendFrame( my_session, my_channel, my_dataframe );

dgDataFrame my_dataframe;
dgClientHandle my_client;
// my_dataframe and my_client are initialized
result = dgSendFrame( my_session, my_client, my_dataframe );

```

4.4.1.2 dgRecvFrame

Function	Receive a GC frame.
Syntax	int dgRecvFrame (dgSessionHandle, dgGryphonNodeHandle <i>source</i> , dgFrameHandle <i>frame</i> , unsigned char <i>cmdId</i>)
Remarks	<p>This function retrieves the next appropriate GC frame from the library receive frame queue. If no frames are queued, it waits (limited by the library timeout period) for the next appropriate frame to be received from the connected Gryphon.</p> <p>The appropriateness of the frame to be retrieved is determined by the parameters.</p> <p>The parameter <i>source</i> can be a dgChannelHandle, a dgClientHandle, a dgUSDTHandle or a generic dgGryphonNodeHandle, indicating the desired source of the frame. If <i>source</i> is NULL, then a frame from any source will be appropriate.</p> <p>The parameter <i>frame</i> indicates the type of frame desired. If the frame handle was created by the call “dgCreateFrameHandle(FT_DATA)”, for example, then FT_DATA is the appropriate type of frame to be retrieved</p>

from the queue. If the frame handle was created by the call “**dgCreateFrameHandle(0)**” then a GC frame having *any* frame type -- other than FT_RESP -- will be appropriate; e.g., FT_DATA, or FT_EVENT, or FT_MISC, etc.

(The exception is made for frames of type FT_RESP because the library itself, during processing of Gryphon Protocol commands on behalf of the client program, retrieves FT_RESP frames from the receive frame queue; the client program, in these cases, would have no interest in retrieving these frames.)

The parameter *cmdId* is 0 in all cases except when attempting to receive a response frame. In this case, *cmdId* is the numeric identifier of the command for which you wish to receive a response.

Receive Frame Queue The receive frame queue is filled by a secondary thread, the main function of which is to wait for GC frames sent from the connected Gryphon, and enqueue those frames. The queue size is limited only by the size of the PC’s virtual memory. Any error conditions detected in the reading thread are reported to the application program in the following way: **dgRecvFrame()** returns FALSE, and a descriptive message is obtained from **dgGetLastOpStatus()**.

Queue overflow If frames are not removed from the queue as fast as they are added then eventually the queue will overflow. The user is notified of this occurrence by a return value of FALSE from **dgRecvFrame()**, followed by the code RESP_RX_FAIL and the string "memory allocation failed" from **dgGetLastOpStatus()**. When the overflow occurs the oldest 10% of the queued frames are deleted in order to restore some virtual memory.

Example:

```
dgDataFrame my_dataframe;
dgChannelHandle my_channel;
// my_dataframe and my_channel are initialized
result = dgRecvFrame( my_session, my_channel, my_dataframe, 0 );
```

```

dgDataFrame my_dataframe;
dgClientHandle my_client;
// my_dataframe and my_client are initialized
result = dgRecvFrame( my_session, my_client, my_dataframe, 0 );

```

```

dgRespFrame my_dataframe;
dgChannelHandle my_channel;
unsigned char cmdID;
// cmdID, my_dataframe, and my_channel are initialized
result = dgRecvFrame( my_session, my_channel, my_dataframe, cmdID );

```

4.4.1.3 dgSetOnRx

Function	Register a callback function, which will be called upon the receipt of a frame of the specified type from the specified source.
Syntax	int dgSetOnRx (dgSessionHandle, const dgGryphonNodeHandle <i>source</i> , PFV <i>callback</i> , dgFrameType <i>frametype</i>)
Remarks	Specify the source by setting parameter <i>source</i> to a dgChannelHandle, dgClientHandle, dgUSDTHandle or dgGryphonNodeHandle. Set <i>source</i> to zero if any source is appropriate. Set <i>callback</i> to point to your function serving as the callback. Set <i>callback</i> to 0 to unregister a previously registered callback. In the Win32 library, a callback will execute in a new thread, so the library is not blocked during callback execution.

Example:

```

dgSetOnRx( gryph_session, my_channel, OnEvent, FT_EVENT );

void OnEvent()
{
    dgRecvFrame(...);    // retrieve the FT_EVENT frame
}

```

}

4.4.2 GC Frame Functions

A Gryphon Communication (GC) Frame is the unit of communication between user applications (clients) and the Gryphon (the server).

The following frame types are defined:

➤ Data Frame (frametype = FT_DATA)

An FT_DATA frame encapsulates a message sent over an automotive / industrial automation network. Such an encapsulated message may be a CAN or J1850 frame, for example.

The Gryphon server sends Data Frames to clients. The Data Frames contain the messages the Gryphon received over network channels.

Clients send Data Frames to the Gryphon server in order to transmit the encapsulated messages over network channels.

➤ Event Frame (FT_EVENT)

The Gryphon sends out Event Frames to inform connected clients of certain events and error conditions, e.g., when a service requested by the client has been completed, or when an error condition has been detected on one of the channels.

➤ Command Frame (FT_CMD)

Commands defined in the GC Protocol can be sent to the Gryphon in Command Frames.

Most of these Gryphon commands are encapsulated in library functions. E.g., the function **dgSetSortMode()** sends the command "CMD_SERVER_SET_SORT" to the Gryphon server, and waits for the corresponding response. For this reason, most users of the library will probably never need to explicitly use FT_CMD frames.

➤ Response Frame (FT_RESP)

Responses to Command Frames are sent via Response Frames.

As in the case of Command Frames, most users of the library will probably never need to use FT_RESP frames.

➤ Miscellaneous Frame (FT_MISC)

Frames of type FT_MISC may be used to transfer data of any format between Gryphon clients.

➤ Text Frame (FT_TEXT)

An FT_TEXT frame is similar to a FT_MISC frame, but its message body is a null-terminated ASCII string.

In the library, GC frames are created and managed with the functions described in this section.

4.4.2.1 GENERIC FRAME FUNCTIONS

4.4.2.1.1 dgCreateFrameHandle

Function	Create and return a dgFrameHandle.
Syntax	dgFrameHandle dgCreateFrameHandle (unsigned char <i>ftype</i>)
Remarks	This function can be called passing one of the following values, or alternatively passing 0 to create a generic GC Frame: FT_DATA FT_EVENT FT_MISC FT_TEXT FT_CMD FT_RESP

Example:

```
dgFrameHandle myframe = dgCreateFrameHandle(FT_DATA);
```

4.4.2.1.2 dgGetSrc

Function	Get the source type of the GC frame.
Syntax	int dgGetSrc (dgFrameHandle, unsigned char* <i>src</i>)
Remarks	The source type field identifies the Gryphon source type of the

sender of the frame.

Gryphon source (and destination) types include the following:

SD_CARD indicates a (vehicle) network interface

SD_SERVER indicates the Gryphon server

SD_CLIENT indicates a client of the Gryphon server

SD_SCHED indicates the Gryphon scheduler process

Example:

```
unsigned char src;
result=dgGetSrc( my_frame, &src );
```

4.4.2.1.3 dgGetSrcChannel

Function Get the source channel field of the GC frame.

Syntax int **dgGetSrcChannel**(dgFrameHandle,
unsigned char* *srcchan*)

Remarks The source channel field of the GC frame is used by the Gryphon to uniquely identify a source/destination node, within a group of possible nodes having the same source type.

Example:

```
unsigned char src_chan;
result=dgGetSrcChannel( my_frame, &src_chan );
```

4.4.2.1.4 dgSetDest

Function Set the destination field of the GC frame.

Syntax int **dgSetDest**(dgFrameHandle, unsigned char *dest*)

Remarks Cf. **dgGetSrc()** for discussion of source/destination types.

4.4.2.1.5 dgSetDestChannel

Function	Set the destination channel field of the GC frame.
Syntax	int dgSetDestChannel (dgFrameHandle, unsigned char <i>destchan</i>)
Remarks	Cf. dgGetSrcChannel () for discussion of source/destination channels.

4.4.2.1.6 dgFrameGetType

Function	Get the frame type of the GC frame.
Syntax	int dgFrameGetType (dgFrameHandle, unsigned char* <i>type</i>)
Remarks	None.

Example:

```
unsigned char m_ftype;
result=dgFrameGetType ( my_frame, &m_ftype );
```

4.4.2.1.7 dgFrameGetData

Function	Get the data from a frame.
Syntax	int dgFrameGetData (dgFrameHandle, unsigned char* <i>data</i> , size_t <i>maxlen</i> , size_t* <i>actual_len</i>)
Remarks	This function applies to frames of type FT_RESP, FT_TEXT, and FT_EVENT. User sets <i>maxlen</i> to max desired length, (e.g. buffer size); <i>actual_len</i> is guaranteed <=maxlen. For FT_TEXT frames, the buffer is returned with the null-terminated data from the frame.

For FT_EVENT and FT_RESP frames, the buffer is returned with the data from the frame, but it is **NOT** null-terminated.

Example:

```
unsigned char my_text[100];
size_t len;
result = dgFrameGetData( my_TEXTframe, my_text, 100, &len );
```

4.4.2.1.8 dgFrameSetData

Function	Set the user data to be encapsulated by the frame.
Syntax	int dgFrameSetData (dgFrameHandle, unsigned char * <i>buffer</i> , size_t <i>length</i>)
Remarks	This function applies to frames of type FT_CMD, FT_TEXT, and FT_MISC. Set <i>length</i> to the length of the data in <i>buffer</i> . The contents of <i>buffer</i> are copied to the "Data" field (w/o padding).

Example:

```
size_t len;
unsigned char* my_data;
// my_data is initialized and len is set to length of relevant data
result = dgFrameSetData( my_frame, m_data, len );
```

4.4.2.1.9 dgFrameGetTimestamp

Function	Get the value of the Timestamp field of the GC event frame.
Syntax	int dgFrameGetTimestamp (dgFrameHandle, unsigned int*)
Remarks	This function applies to frames of type FT_DATA and FT_EVENT. The timestamp is in units of 10 microseconds.

Example:

```
unsigned int m_timestamp;
result=dgFrameGetTimestamp( my_frame, &m_timestamp );
```

4.4.2.1.10 dgGetContext

Function Get the value of the Context field of the GC frame.

Syntax int **dgGetContext** (dgFrameHandle, unsigned char*)

Remarks This function applies to frames of type FT_RESP and FT_EVENT.

Example:

```
unsigned char my_context;
result = dgGetContext( my_frame, &my_context );
```

4.4.2.1.11 dgSetContext

Function Set the value of the Context field of the frame.

Syntax int **dgSetContext** (dgFrameHandle, unsigned char)

Remarks This function applies to frames of type FT_CMD.

Example:

```
unsigned char m_context;
dgFrameHandle my_frame;
// my_frame is initialized
result = dgSetContext( my_frame, m_context );
```

DATA FRAME–SPECIFIC FUNCTIONS

4.4.2.2.1 dgGetHeaderLength

Function	Get the value of the Header Length field of a GC data frame.
Syntax	int dgGetHeaderLength (dgFrameHandle, unsigned char*)
Remarks	The Header Length field specifies the length in bytes of the header segment of the payload message.

Example:

```
unsigned char m_len;
result = dgGetHeaderLength( my_dataframe, &m_len );
```

4.4.2.2.2 dgSetHeaderLength

Function	Set the value of the Header Length field of the GC data frame.
Syntax	int dgSetHeaderLength (dgFrameHandle, unsigned char)
Remarks	The Header Length field specifies the length of the header segment of the payload message. The default value is zero.

Example:

```
result = dgSetHeaderLength( my_CANframe, 2 );
```

4.4.2.2.3 dgGetHeaderBits

Function	Get the value of the Header Bits field of a GC data frame.
Syntax	int dgGetHeaderBits (dgFrameHandle, unsigned char*)
Remarks	The Header Bits field specifies the length in bits of the actual payload message header for cases where the number of bits in the header is not an even multiple of eight (such as in the case for CAN, with 11 and 29 bit headers).

Example:

```
unsigned char m_numbits;
```

```
result = dgGetHeaderBits( dgFrameHandle, &m_numbits );
```

4.4.2.2.4 dgSetHeaderBits

Function Set the value of the Header Bits field of a GC data frame.

Syntax int **dgSetHeaderBits** (dgFrameHandle, unsigned char)

Remarks The Header Bits field specifies the length in bits of the payload message header for cases where the number of bits in the header is not an even multiple of eight (such as in the case for CAN, with 11 and 29 bit headers). The default value is zero.

Example:

```
result = dgSetHeaderBits( my_CANframe, 11 );
```

4.4.2.2.5 dgGetDataLength

Function Get the value of the Data Length field of a GC data frame.

Syntax int **dgGetDataLength** (dgFrameHandle, unsigned short*)

Remarks The Data Length field specifies the length in bytes of the data segment of the payload message.

Example:

```
unsigned short m_datalength;
result = dgGetDataLength ( my_dataframe, m_datalength );
```

4.4.2.2.6 dgSetDataLength

Function Set the value of the Data Length field of a GC data frame.

Syntax int **dgSetDataLength** (dgFrameHandle, unsigned short)

Remarks The Data Length field specifies the length in bytes of the data segment of the payload message. The default value is zero.

Example:

```
result=dgSetDataLength ( my_dataframe, 5 );
```

4.4.2.2.7 dgGetExtraLength

Function Get the value of the Extra Length field of a GC data frame.

Syntax int **dgGetExtraLength** (dgFrameHandle, unsigned char*)

Remarks The Extra Length field specifies the length in bytes of the extra information segment of the payload message.

Example:

```
unsigned char m_extralen;
result = dgGetExtraLength( my_dataframe, &m_extralen );
```

4.4.2.2.8 dgSetExtraLength

Function Set the value of the Extra Length field of a GC data frame.

Syntax int **dgSetExtraLength** (dgFrameHandle, unsigned char)

Remarks The Extra Length field specifies the length in bytes of the extra information segment of the payload message. The default value is zero.

Example:

```
result = dgSetExtraLength( my_dataframe, 2 );
```

4.4.2.2.9 dgGetMode

Function Get the value of the mode field of a GC data frame.

Syntax int **dgGetMode** (dgFrameHandle, unsigned char*)

Remarks The mode field contains the following flags:
 MODE_RX – Indicates that the Gryphon received the message.
 MODE_TX – Indicates that the message was transmitted by the Gryphon

For a listing of additional hardware specific modes, please see the

“Gryphon Hardware Information” web pages for supported mode values.

Example:

```
unsigned char m_mode;
result = dgGetMode ( my_dataframe, &m_mode );
```

4.4.2.2.10 dgSetMode

Function Set the value of the mode field of a GC data frame.

Syntax int **dgSetMode** (dgFrameHandle, unsigned char)

Remarks Refer to **dgDataFrame::SetMode()** in the Gryphon C++ User Manual for details.

Example:

```
result = dgSetMode ( my_dataframe, MODE_REMOTE );
```

4.4.2.2.11 dgGetErrorStatus

Function Get the value of the status field of a GC data frame.

Syntax int **dgGetErrorStatus**(dgFrameHandle, unsigned char*)

Remarks The status field contains network-specific flags and status information.

Example:

```
unsigned char stat;
result = dgGetErrorStatus( my_dataframe, &stat );
```

4.4.2.2.12 dgSetErrorStatus

Function Set the value of the status field of a GC data frame.

Syntax int **dgSetErrorStatus**(dgFrameHandle, unsigned char)

Remarks The status field contains network-specific flags and status information.

Example:

```
unsigned char UBP_nak = 1;
result = dgSetErrorStatus( my_dataframe, UBP_nak );
```

4.4.2.2.13 dgGetPayload

Function	Get the data that has been sent across the channel's network (e.g., data sent on a J1850 network)
Syntax	int dgGetPayload (dgFrameHandle, unsigned char* <i>buffer</i> , unsigned int <i>max_len</i>)
Remarks	The parameter <i>buffer</i> is a pointer to a buffer in the user's program. The number of bytes copied into the user's buffer is the sum of the data frame's Header Length, Data Length, and Extra Length fields, up to but not exceeding <i>max_len</i> .

Example:

```
unsigned char buffer[MAX];
result = dgGetPayload ( dgFrameHandle, buffer, MAX );
```

4.4.2.2.14 dgSetPayload

Function	Set the data to be transmitted across the channel's network (e.g., data to be transmitted on a J1850 network)
Syntax	int dgSetPayload (dgFrameHandle, unsigned char* <i>buffer</i>)
Remarks	<i>buffer</i> points to a buffer in the user's program. The number of bytes copied from the buffer is the sum of the data frame's Header Length, Data Length, and Extra Length fields. This implies that the proper lengths must be set by calling SetHeaderLength() , etc., prior to calling this function.

Example:

```
unsigned char *m_payload;
// SetHeaderLength() is called and m_payload is initialized to an array of
// unsigned char with the message's payload
```

```
result = dgSetPayload( my_dataframe, m_payload );
```

4.4.2.3 EVENT FRAME-SPECIFIC FUNCTIONS

4.4.2.3.1 dgGetEventId

Function Get the Event identification number of the event.

Syntax int **dgGetEventId** (dgFrameHandle, dgEventId*)

Remarks Please see the module documentation for card specific events.

Example:

```
dgEventId my_id;
dgFrameHandle my_eventframe;
// my_eventframe is initialized
result = dgGetEventId ( my_eventframe, &my_id );
```

4.4.2.4 COMMAND FRAME-SPECIFIC FUNCTIONS

4.4.2.4.1 dgGetCmd

Function Get the identifier of the command to be executed at the destination.

Syntax int **dgGetCmd**(dgFrameHandle, unsigned char*)

Remarks None.

Example:

```
unsigned char my_cmd;
result = dgGetCmd( my_frame, &my_cmd );
```

4.4.2.4.2 dgSetCmd

Function Set the identifier of the command to be executed at the destination.

Syntax int **dgSetCmd**(dgFrameHandle, unsigned char)

Remarks None.

Example:

```
result = dgSetCmd( my_frame, CMD_CARD_IOCTL );
```

4.4.2.4.3 dgSetCmdData

Function Set the command-specific data.

Syntax int **dgSetCmdData** (dgFrameHandle,
 unsigned char* *buffer*,
 size_t *count*)

Remarks *count* number of bytes is copied from the user's buffer pointed to by *buffer* to the command frame.

Example:

```
unsigned char *m_buffer, m_len;
// m_buffer is initialized with data and m_len is initialized with the
// length of m_buffer
result = dgSetCmdData( my_frame, m_buffer, m_len );
```

4.4.2.5 RESPONSE FRAME–SPECIFIC FUNCTIONS

4.4.2.5.1 dgGetRespCmd

Function	Get the command Id number of the original command frame in response to which the response frame was sent.
Syntax	int dgGetRespCmd (dgFrameHandle, unsigned char*)
Remarks	None.

Example:

```
unsigned char my_cmd;
result = dgGetRespCmd( my_frame, &my_cmd );
```

4.4.2.5.2 dgGetReturnCode

Function	Get the return code of the response frame.
Syntax	int dgGetReturnCode (dgFrameHandle, unsigned int*)
Remarks	A return code is a four-byte value that indicates the result of the command execution. Please see command specific documentation for response data for a particular command.

Example:

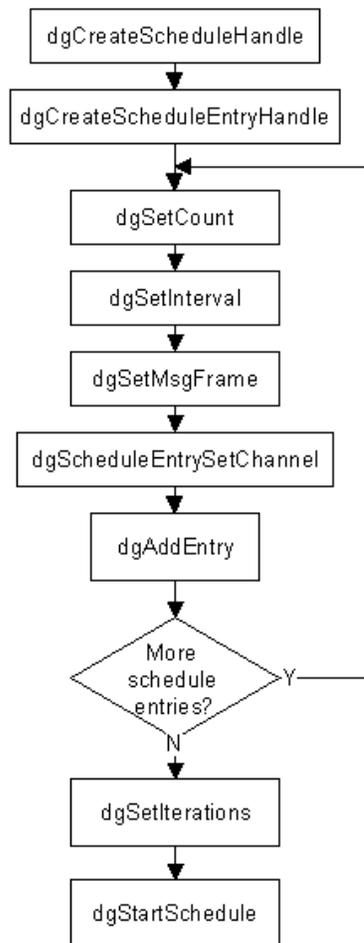

```
unsigned int m_retval;
result = dgGetReturnCode( my_frame, &m_retval );
```

4.5 Network Services – Advanced

Functions in this section provide advanced methods for sending and receiving bus data frames over a Gryphon's installed data link channels (Scheduler and Responder), as well as configuring higher layer protocols (USDT).

4.5.1 Scheduler Functions

The following flowchart shows an example sequence for the setting up of a Gryphon scheduler:

4.5.1.1 dgCreateScheduleHandle

Function	Create and return a dgScheduleHandle.
Syntax	dgScheduleHandle dgCreateScheduleHandle()
Remarks	None.

Example:

```
dgScheduleHandle mySched = dgCreateScheduleHandle();
```

4.5.1.2 dgStartSchedule

Function	Start the schedule process represented by the second parameter.
Syntax	int dgStartSchedule (dgSessionHandle, dgScheduleHandle, PFV <i>p_pfv</i>)
Remarks	<i>p_pfv</i> is a pointer to the function to be called when the schedule finishes. Alternately, if no callback is desired, supply a zero value in place of the pointer. PFV is a typedef for a pointer to a function returning a void.

Example:

```
dgScheduleHandle m_mysched;  
// Initialize m_mysched  
result = dgStartSchedule(my_session, m_mysched, NULL);
```

4.5.1.3 dgModifyScheduleEntry

Function	Replace the data frame associated with a schedule entry of a currently active dgSchedule.
Syntax	int dgModifyScheduleEntry (dgSessionHandle, dgScheduleHandle, unsigned char <i>index</i> , dgFrameHandle,

unsigned char ucFlags,
unsigned short usSize)

Remarks

The first dgScheduleEntry added to a dgSchedule (cf. **dgAddEntry ()**) is referenced by the *index* value of 0, the second by the value of 1, and so on.

UcFlags is optional, defaults to 0. If ucFlags is 1, flush the messages in the delay queue keeping only those that will be output within the time in milliseconds present in the usSize field. If ucFlags is 0, keep all current message in the Delay queue.

usSize is optional, defaults to 0. usSize is the maximum amount of time in milliseconds that the previously scheduled message(s) will be output.

4.5.1.4 dgStopSchedule**Function**

Stop the Gryphon's schedule process represented by the parameter.

Syntax

int **dgStopSchedule**(dgSessionHandle, dgScheduleHandle)

Remarks

None.

Example:

```
dgScheduleHandle m_my Sched;
// m_my Sched is initialized and started
result = dgStopSchedule(my_session, m_my Sched);
```

4.5.1.5 dgScheduleActive**Function**

Indicates if the schedule process corresponding to the dgScheduleHandle object is currently active in this Gryphon session.

Syntax

int **dgScheduleActive** (dgSessionHandle, dgScheduleHandle)

Remarks

This function is accurate as long as there is only one client issuing Scheduler commands to the Gryphon device. For example, this would be inaccurate in the case where the

current client starts a schedule that a second client then kills (e.g., using **dgKillSchedules()**) before the schedule runs to completion.

Example:

```
if ( dgScheduleActive( my_session, my_sched ) )
    // my_sched is active
else
    // my_sched is inactive
```

4.5.1.6 dgKillSchedules

Function Remove all existing schedules on a Gryphon.

Syntax int **dgKillSchedules**(dgSessionHandle)

Remarks None.

Example:

```
result = dgKillSchedules( my_session );
```

4.5.1.7 dgSetCritical

Function Specify whether the Gryphon schedule object is to be time-critical or not.

Syntax int **dgSetCritical** (dgScheduleHandle, int *boole*)

Remarks Time deviations in non-critical schedules will be dictated by bus activity and other processes running and may vary from situation to situation.

boole values:

False : “not critical” : The time intervals specified may not be strictly honored.

True : “critical” : Efforts will be made to honor the time intervals.

Example:

```
result = dgSetCritical( my_schedule, TRUE );
```

4.5.1.8 dgSetIterations

Function Set the number of iterations of the list of schedule entries.

Syntax int **dgSetIterations** (dgScheduleHandle, unsigned int)

Remarks A value of 0xFFFFFFFF indicates an indefinite number of iterations. Entries in the list are processed serially.

Example:

```
result = dgSetIterations ( my_schedule, 100 );
```

4.5.1.9 dgAddEntry

Function Add an entry to a list to be scheduled.

Syntax int **dgAddEntry** (dgScheduleHandle,
dgScheduleEntryHandle)

Remarks Please see dgScheduleEntry class functions for information on setting up the messages to be added.

Example:

```
dgScheduleEntryHandle m_schentry;
// m_schentry is initialized
result = dgAddEntry( m_schedule, m_schentry );
```

4.5.1.10 dgCreateScheduleEntryHandle

Function Create and return a dgScheduleEntryHandle.

Syntax dgScheduleEntryHandle **dgCreateScheduleEntryHandle**()

Remarks None.

Example:

```
dgScheduleEntryHandle myentry = dgCreateScheduleEntryHandle();
```

4.5.1.11 dgSetMsgFrame

Function Set the message frame to be transmitted.

Syntax int **dgSetMsgFrame** (dgScheduleEntryHandle,
dgFrameHandle)

Remarks This is a copy operation for the frame.

Example:

```
dgFrameHandle my_dataframe;
// my_dataframe is initialized ...
result = dgSetMsgFrame( my_scheduledentry, my_dataframe );
```

4.5.1.12 dgScheduleEntrySetChannel

Function Specify the channel over which the data frame will be transmitted.

Syntax int **dgSetScheduleChannel** (dgScheduleEntryHandle,
dgChannelHandle)

Remarks None.

Example:

```
dgChannel m_channel;
// m_channel is initialized using the functions in dgChannel
result = dgSetScheduleChannel ( my_scheduledentry, m_channel );
```

4.5.1.13 dgSetInterval

Function Set the interval, in milliseconds, between successive transmissions of a message.

Syntax int **dgSetInterval** (dgScheduleEntryHandle,
unsigned int *interval*)

Remarks None.

Example:

```
result = dgSetInterval( my_scheduleentry, 1000 ); // 1 sec interval
```

4.5.1.14 dgSetCount

Function Set the number of times that the message is to be transmitted.

Syntax int **dgSetCount** (dgScheduleEntryHandle,
unsigned int *count*)

Remarks None.

Example:

```
result = dgSetCount( my_scheduleentry, 100 );
// message will be sent 100 times
```

4.5.1.15 dgSetDelay

Function Set the number of milliseconds to wait before the initial transmit of the message owned by this object within each iteration of the dgSchedule object.

Syntax int **dgSetDelay** (dgScheduleEntryHandle, unsigned int *delay*)

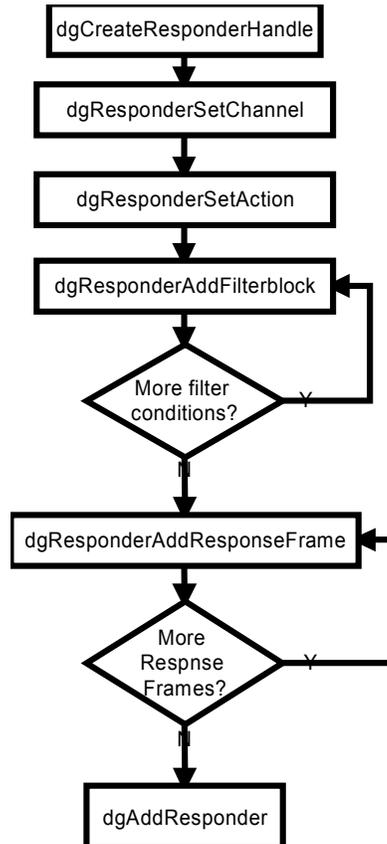

Remarks TBD

Example:

```
result = dgSetDelay( my_scheduleentry, 100 );
// 100ms delay before first message is sent
```

4.5.2 Responder Functions

As an overview, the following flowchart illustrates a typical way of setting up a message responder:

4.5.2.1 dgCreateResponderHandle

Function Create and return a dgResponderHandle.

Syntax dgResponderHandle **dgCreateResponderHandle()**

Remarks None.

Example:

```
dgResponderHandle myresponder = dgCreateResponderHandle();
```

4.5.2.2 dgAddResponder

Function Add a message responder client to the Gryphon.

Syntax int **dgAddResponder** (dgSessionHandle,
dgResponderHandle)

Remarks None.

Example:

```
dgResponderHandle m_myresp;
// Initialize m_myresp
result = dgAddResponder(my_session, m_myresp);
```

4.5.2.3 dgDeleteResponder

Function Delete the message responder client from the Gryphon.

Syntax int **dgDeleteResponder** (dgSessionHandle,
dgResponderHandle)

Remarks None.

Example:

```
dgResponderHandle m_myresp;
// m_myresp is initialized and started
result = dgDeleteResponder(my_session, m_myresp);
```

4.5.2.4 dgKillResponders

Function Remove all existing responders on a single or on all channels of a Gryphon.

Syntax int **dgKillResponders**(dgSessionHandle, dgChannelHandle)

Remarks If a pointer to a channel object is passed to the function, all of the responders on that channel are removed. If a NULL is passed to the function, all of the responders on all of the channels are removed.

An error code of 6 (Invalid parameter(s)) will return if no

responders are deleted.

Example:

```
result = dgKillResponders(my_session, NULL);
// Kills all responders on all channels

dgChannelHandle m_channel;
// m_channel is initialized and one or more responders have been
// started on it.
result = dgKillResponders( my_session, m_channel );
```

4.5.2.5 dgResponderSetChannel

Function Specify the channel to monitor for data and event messages.

Syntax int **dgResponderSetChannel** (dgResponderHandle,
dgChannelHandle)

Remarks None.

Example:

```
dgChannelHandle m_channel;
//m_channel is initialized using the functions in dgChannel
result = dgResponderSetChannel(my_responder, m_channel);
```

4.5.2.6 dgResponderSetActive

Function Set the responder object active or inactive.

Syntax int **dgResponderSetActive** (dgSessionHandle,
dgResponderHandle,
int *flag*)

Remarks While inactive, no response messages are issued by the responder object.
flag is a boolean.

Example:

```
result = dgResponderSetActive( my_session, my_responder, TRUE );
```

4.5.2.7 dgResponderSetAction

Function Specify the action to be performed upon receipt of conforming data frames.

Syntax int dgResponderSetAction(dgResponderHandle, unsigned char *action*)

Remarks The first three entries to follow are action codes; only one action code may be present. The remaining are action flags that may be ORed with any of the three action codes.

Action Codes

FR_RESP_AFTER_EVENT Response messages are sent upon receipt of a message that conforms to the filter conditions.

FR_RESP_AFTER_PERIOD Response messages are sent after the specified time has expired, following the receipt of a message that conforms to the filter conditions. If conforming messages continue to arrive before the specified time has elapsed, no messages are sent. If no conforming message is received, the response messages are sent out periodically.

FR_IGNORE_DURING_PER The response messages are not sent for the specified time following the receipt of a message that conforms to the filter conditions. This effectively causes incoming messages to be ignored for the specified time after a response has been sent.

Action Flags

FR_PERIOD_MSGS This is a flag that can be ORed with one of the above values. When present, the time values referred to can be changed into message counters.

FR_DEACT_AFTER_PER This is a flag that can be ORed with one of the above values. When present, the response will deactivate itself after the specified time, following the receipt of a message that conforms to the filter. This

option may be used to limit the amount of time that a given response is valid.

FR_DEACT_AFTER_PERIOD This is a flag that can be ORed with one of the above values. When present, the response will deactivate itself upon the receipt of a conforming message.

FR_DELETE This is a flag that can be ORed with either of the two previous flags, in order to change the action from deactivating a response to deleting it.

Default value: **FR_RESP_AFTER_EVENT**

Example:

```
result = dgResponderSetAction(my_responder, FR_RESP_AFTER_PERIOD );

unsigned char m_action;
//m_action is initialized
result = dgResponderSetAction( my_responder, m_action );
```

4.5.2.8 dgResponderSetActionValue

Function Set the amount of time in tens of milliseconds, or the number of conforming messages to use for the period specified by the **dgResponderSetAction()** function.

Syntax int **dgResponderSetActionValue** (dgResponderHandle, unsigned short *value*)

Remarks None.

Example:

```
//dependant on dgResponderSetAction()
unsigned short m_actionval;
// m_actionval is initialized
result = dgResponderSetActionValue( my_responder, m_actionval );
```

4.5.2.9 dgResponderAddFilterblock

Function	Add filter information for the message responder.
Syntax	int dgResponderAddFilterblock (dgResponderHandle, dgFilterBlockHandle)
Remarks	Each filter block specifies a section of the message to be checked. In order for a message to conform to a condition, it must conform to all of the defined blocks. This is a copy operation.

Example:

```
dgFilterBlockHandle m_filterblock;
// m_filterblock is initialized using the functions in dgFilterblock
result = dgResponderAddFilterBlock( m_filterblock );
```

4.5.2.10 dgResponderAddResponseFrame

Function	Add a response frame for the message responder.
Syntax	int dgResponderAddResponseFrame (dgResponderHandle, dgFrameHandle)
Remarks	When creating a message responder, all calls to dgResponderAddFilterblock() must be made prior to any call to dgResponderAddResponseFrame() , for that message responder. Each response message is a complete GC frame. This is a copy operation.

Example:

```
dgFrameHandle m_frame;
//m_frame is initialized
result = dgResponderAddResponseFrame( my_responder, m_frame );
```

4.5.2.11 dgResponderSetReplacement

Function	Specify that a previously created responder is to be replaced
-----------------	---

4.5.3.1 dgCreateUSDTHandle

Function	Create and return a dgUSDTHandle.
Syntax	dgUSDTHandle dgCreateUSDTHandle()
Remarks	The handle is a representation of a USDT (ISO 15765-2 "network layer") node.

Example:

```
dgUSDTHandle my_flowcontrol_node = dgCreateUSDTHandle();
```

4.5.3.2 dgSetActive

Function	Activate or deactivate the USDT service.
Syntax	int dgSetActive (dgUSDTHandle, int <i>boole</i>)
Remarks	<p>When activating the service, the service parameters set by all the following USDT functions (loopback, event reporting, etc.) are used. For this reason, the other functions must be called before calling this function in order for those service parameters to be in effect during the activation period.</p> <p>When deactivating the service, all the service parameters are irrelevant.</p>

Example:

```
if( ! dgSetActive(my_flowcontrol_node, 1 ) )
    handle_error();
```

4.5.3.3 dgReportEventId

Function	Determines if a specific event notification is to be delivered to the client application, or if it should be discarded.
Syntax	int dgReportEventId (dgUSDTHandle, dgEventId <i>eventId</i> , int <i>boole</i>)
Remarks	The default state is to report all ISO 15765-2 events. Some

dgEventIds which are configurable here are:

```
USDT_FIRSTFRAME
USDT_LASTFRAME
USDT_DONE
USDT_ERROR
```

Example:

```
// specify that USDT_LASTFRAME events will NOT be reported:
if( ! dgReportEventId (my_flowcontrol_node, USDT_LASTFRAME, 0 )
    handle_error();
```

4.5.3.4 dgSetDataLink

Function	Specify which Gryphon CAN channel to use for data link services.
Syntax	int dgSetDataLink (dgUSDTHandle, dgChannelHandle)
Remarks	The dgChannelHandle must reference a CAN hardware channel by having previously been returned by a successful call to dgGetChannel () .

Example:

```
my_CAN_channel = dgGetChannel( session, idx );
// ensure the channel handle references the desired CAN channel...

if( ! dgInit( my_CAN_channel, 1 ))
    handle_error();

if( ! dgSetDataLink(my_flowcontrol_node, my_CAN_channel ) )
    handle_error();
```

4.5.3.5 dgSetPad

Function	Specify desired message padding.
Syntax	int dgSetPad (dgUSDTHandle, unsigned char <i>mode</i>)

4.5.3.8 dgSetIdBlock

Function	Specify the correspondence between Network Source Addresses and Network Target Addresses for 11-bit CAN identifiers.
Syntax	int dgSetIdBlock (dgUSDTHandle, unsigned char <i>blkIndex</i> , unsigned <i>blkSize</i> , unsigned <i>N_TA</i> , unsigned <i>N_SA</i>)
Remarks	<p>ISO 15765-2 specifies how (8-bit) Network Source Address (<i>N_SA</i>) and Network Target Address (<i>N_TA</i>) values are mapped into 29-bit CAN identifiers, but, curiously, does not specify how to map 16 bits into an 11-bit CAN identifier.</p> <p>This function allows the application to assign the correspondences between sets of <i>N_SA</i> and <i>N_TA</i> values for 11-bit CAN identifiers, to be used by the Gryphon USDT server for segmented message transport.</p> <p>You can specify up to 64 such Id blocks, using <i>blkIndex</i> values from 0 to 63. Specifying an Id block with <i>blkSize</i> = 0 removes a previously specified Id block at that index position.</p> <p>If this function is not called, then default Id blocks are used by the USDT server.</p> <p>See subdirectory "GCprotocol/commands/USDT" of [Ref. 2] for default block value(s) and other details.</p>

Example:

```
if( ! dgSetIdBlock( my_flowctrl_node, 0, 32, 0x0640, 0x0240 ))
    handle_error();
```

4.5.3.9 dgSetFilterMode

Function	Specify whether messages received by the node are to be blocked, filtered or passed to the client application.
Syntax	int dgSetFilterMode (dgUSDTHandle <i>handle</i> ,

unsigned char *mode*)

Remarks Parameter *mode* values:

FILTER_OFF_BLOCK_ALL : No messages are to be passed to the client. This option also disables timeout and sequence error event reporting.

FILTER_OFF_PASS_ALL : All messages are passed to the client (default). This option also enables timeout and sequence error event reporting.

Examples:

```
result = dgSetFilterMode (my_flowcontrol_node, FILTER_OFF_PASS_ALL);

if( ! dgSetFilterMode( my_flowcontrol_node, FILTER_OFF_BLOCK_ALL ) )
    handle_error();
```

4.5.3.10 dgEnableLoopback

Function Enable or disable the echo back to the client application of transmitted messages.

Syntax int **dgEnableLoopback** (dgUSDTHandle, int *boole*)

Remarks Default = no loopback

Example:

```
result = dgEnableLoopback( my_flowcontrol_node, TRUE );
```

4.5.3.11 dgReportAllEvents

Function Enable or disable reporting of all node events to the client application.

Syntax int **dgReportAllEvents** (dgUSDTHandle *handle*, int *boole*)

Remarks The parameter *boole* is a boolean value which determines if all Event types should be filtered out or not.

boole:

0 = Reports no events to the client.

1 = Reports all events to the client (default).

Example:

```
result = dgReportAllEvents ( my_channel, 1 );
```

4.6 Miscellaneous Services

4.6.1 Program Loader Functions

4.6.1.1 dgAddFile

Function Copy a file from the local file system to the Gryphon.

Syntax int **dgAddFile** (dgSessionHandle,
dgFileHandle,
int *flags*)

Remarks The parameter *flags* can be used to specify options of the file transfer. It may be a combination of the following constants:

dgOVERWRITE: This flag specifies that the file copy operation is to replace any previously uploaded file having the same name.

dgASCII : Specifies that the file is a text file and that DOS to Linux end-of-line character conversion should be performed (CR-LF to LF character).

The value 0 for *flags* specifies that there is no overwrite of a file with the same name that was previously uploaded to the Gryphon, and no end-of-line character conversion.

Example:

```
dgFile myfile;  
// myfile is initialized  
result = dgAddFile( my_session, my_file, dgOVERWRITE);
```

4.6.1.2 dgDeleteFile

Function	Delete the previously uploaded file from the Gryphon.
Syntax	int dgDeleteFile (dgSessionHandle, dgFileHandle)
Remarks	None.

Example:

```
dgFile myfile;
// myfile is initialized
result = dgDeleteFile( my_session, my_file );
```

4.6.1.3 dgStartProgram

Function	Start the execution on the Gryphon of an uploaded executable file.
Syntax	int dgStartProgram (dgSessionHandle, dgFileHandle, unsigned char * <i>args</i>)
Remarks	The parameter <i>args</i> can optionally be used to specify the command line arguments to be supplied to the executable. The first 119 characters of the parameter string will be used.

Example:

```
dgFile myfile;
// myfile is initialized
result = dgStartProgram( my_session, my_file, "" );
```

4.6.1.4 dgStopProgram

Function	Stop the execution on the Gryphon of an uploaded executable.
Syntax	int dgStopProgram (dgSessionHandle, dgFileHandle)
Remarks	None.

Example:

```

dgFile myfile;
// myfile is initialized and started as a program
result = dgStopProgram( my_session, my_file );

```

4.6.2 dgFile Functions**4.6.2.1 dgCreateFileHandle**

Function Create and return a dgFileHandle.

Syntax dgFileHandle **dgCreateFileHandle()**

Remarks None.

Example:

```

dgFileHandle myfile = dgCreateFileHandle();

```

4.6.2.2 dgSetName

Function Specify the name of the file to be copied to the Gryphon.

Syntax int **dgSetName** (dgFileHandle, unsigned char *)

Remarks None.

Example:

```

dgFileHandle myfile;
unsigned char fname[256];
// myfile is initialized
strcpy(fname, "test.out");
result = dgSetName( my_file, fname );

```

4.6.2.3 dgSetPath

Function Specify the location of the file (on the local file system) to be copied to the Gryphon.

Syntax int **dgSetPath** (dgFileHandle, unsigned char *)

Remarks Do not include a trailing directory separator character.

If this function is not invoked, the default path to the file is the root directory.

Example:

```
dgFileHandle myfile;
unsigned char mypath[256];
// myfile is initialized
strcpy( mypath, "C:\temp");
result = dgSetPath ( my_file, mypath );
```

4.6.2.4 dgSetDescription

Function Assign a text description of the dgFile object.

Syntax int **dgSetDescription** (dgFileHandle,
unsigned char * *string*)

Remarks Only the first 80 characters of the parameter *string* will be used.

Example:

```
dgFileHandle myfile;
unsigned char desc[256];
// myfile is initialized
strcpy( desc, "Test Program");
result = dgSetDescription ( my_file, desc );
```

4.6.2.5 dgSetExecutable

Function Specify whether the uploaded file should be set as "executable" in the Gryphon.

Syntax int **dgSetExecutable** (dgFileHandle, int)

Remarks None.

Example:

```

dgFileHandle myfile;
// myfile is initialized
result = dgSetExecutable ( my_file, TRUE );

```

4.6.3 dgClient Functions

dgClientHandles can be used in the functions **dgSendFrame()**, **dgRecvFrame()**, and **dgSetOnRx()**, to send/receive GC frames to/from other Gryphon clients.

4.6.3.1 dgCreateClientHandle

Function	Create and return a dgClientHandle.
Syntax	dgClientHandle dgCreateClientHandle()
Remarks	None.

Example:

```

dgClientHandle other_client = dgCreateClientHandle();

```

4.6.4 dgGryphonNode Functions

A dgGryphonNode is a generic representation of a node in the Gryphon network which can act as a source and destination for GC frames. For example, a dgGryphonNodeHandle can be used in the functions **dgSendFrame()**, **dgRecvFrame()**, and **dgSetOnRx()**, to send/receive GC frames to/from other Gryphon clients.

In the C++ library, **dgGryphonNode** is the base class for **dgChannel**, **dgClient** and **dgUSDT** classes.

4.6.4.1 dgCreateGryphonNodeHandle

Function	Create and return a dgGryphonNodeHandle.
Syntax	dgGryphonNodeHandle dgCreateGryphonNodeHandle()
Remarks	None.

4.6.4.2 dgGetNodeType

Function	Query the type of the Gryphon node.
Syntax	int dgGetNodeType (dgGryphonNodeHandle, unsigned char* <i>type</i>)
Remarks	<i>type</i> may be SD_CLIENT , SD_CARD or SD_USDT .

4.6.4.3 dgSetNodeType

Function	Set the type of the Gryphon node.
Syntax	int dgSetNodeType (dgGryphonNodeHandle, unsigned char <i>type</i>)
Remarks	See previous function for valid <i>type</i> values.

4.6.4.4 dgGetNodeId

Function	Get the numeric identifier of the Gryphon node.
Syntax	int dgGetNodeId (dgGryphonNodeHandle, unsigned char* <i>id</i>);
Remarks	Within each Gryphon node "Type", each instance will have a unique numeric identifier.

4.6.4.5 dgSetNodeId

Function	Set the numeric identifier of the Gryphon node.
Syntax	int dgSetClientId (dgGryphonNodeHandle, unsigned char <i>id</i>)
Remarks	The reserved value CH_BROADCAST can be used as the <i>id</i> value to specify a broadcast target of all clients when the dgClientHandle is passed to dgSendFrame() .

Example:

```
dgClientHandle myclient = dgCreateClientHandle();
result = dgSetNodeId ( myclient, CH_BROADCAST );
```

Appendix A: Visual BASIC

Notes

- In the Visual BASIC module, there exists one user-defined type named `dgSessionRequest`. This user-defined type is passed as a parameter to `dgBeginSession()`.
- All other data types convert directly from C data types to Visual BASIC data types. Please see the Gryphon Visual BASIC module for the complete list of the Visual BASIC **Declare** statements.
- Any Visual BASIC String that is passed into a function in the library in order to retrieve information must have space already allocated to it. Furthermore, the string must be 1 byte longer than the length that is passed to the function as the 'max length'. This can be done in two ways:
 - Using fixed-length strings:
 - `dim namestring as String * 1025`
 - `dgGryphonGetName(m_session, namestring, 1024)`
 - Using variable length strings, assign a value to them before passing them to a function:
 - `dim namestring as String`
 - `namestring = Space$(1025)`
 - `dgGryphonGetName(m_session, namestring, 1024)`
- All functions, unless otherwise documented, return **dgFail** on failure. Any other return value indicates success. If a function fails, `dgGetLastOpStatus()` may be called to get the error code and error string.
